class 14: RNA-Seq analysis

Chloe Wong (PID: A16893383)

Today we will complete an RNASeq analysis from counts to pathways.

We will work with data on differential analysis of lung fibroblasts in response to loss of the developmental transcription factor HOXA1.

Q. Complete the code below to filter countData to exclude genes (i.e. rows) where we have 0 read count across all samples (i.e. columns).

Tip: What will rowSums() of countData return and how could you use it in this context?

There are tons of zero count genes that we can get rid of

countData = countData[rowSums(countData) >0, ]

The pathway that has the most significant "Entities p-value" is the pathway with the smallest p-value. In our case, this would be hsa04110. The most significant pathways listed do match my previous KEGG results. Differences between the two methods could be human error.
